

5300 Centrokappa

This mini seat for children is composed of two U-shaped elements which form the legs and the body. The legs are fixed by way of chunky plastic screws under the surface of the seat body and come with rubber caps which limit noise during displacement of the chairs. The body of the chair is a single, flat and slim panel. At the sides of the seat are two lateral holes which function as handles and which enable horizontal coupling as well as stacking. The operation of lateral fastening, which children can manage too, allows long rows of seating to be arranged in a short time.
