

# Spoon Chair Antonio Citterio with Toan Nguyen

The technology used in the design of the Spoon Chair makes this an outstandingly avant-garde object: the "layered" effect is achieved using specific processing techniques, which results in a stylish material that has high levels of mechanical resistance and a width which is easy to customise. The Spoon Chair consists in a batch-formed monocoque body, the reinforced curved connection of the shaft to the central stem provides maximum levels of flexibility and comfort. The lever that regulates the mechanism is perfectly hidden away inside the shaft. It is fitted with a replaceable cushion in the same colour, it has two comfortable arm-rests and moves on castors.
